Design-by-Contract Approach

Hernán Melgratti

18 February 2020 @ Pisa

Design-by-Contract ¹

Basics

- ▶ To specify the constraints that govern the design and correct use of a class
- ▶ Contract:
 - Class invariant: assertions about the state of an object that hold before and after each method call
 - Preconditions: assertions about the state of the object and the argument values that must hold prior to invoking the method
 - Postconditions: assertions about the state of the object after the execution of a method

¹Bertrand Meyer. Applying Design by Contract. In Computer IEEE, vol. 25, no. 10, October 1992

Example

Bank Account

- ▶ Property: balance
- ► Operations: deposit(int amt), withdraw(int amt)
- ▶ Invariant: balance > 0
- deposit(int n):
 - ▶ **pre**: *n* > 0
 - post: balance' = balance + n
- withdraw(int n):
 - ▶ pre: n < balance</p>
 - ▶ post: balance' = balance n

Interpretation

- ▶ Precondition: an obligation for the client and a guarantee for the supplier
- ▶ Postcondition: an obligation for the supplier and a guarantee for the client
- ▶ Invariant: a property that is **assumed on entry** and **guaranteed on completion**

Implementation

- ▶ The code is enriched with a specification of the contract
- ▶ A run-time mechanism monitors the satisfaction of the contract
 - 1. When a client invokes an method, the precondition is checked and an **exception is** raised if the precondition is violated
 - the client is blamed
 - 2. The provider executes the invoked code
 - After completion, the postcondition is evaluated and an exception is raised if the postcondition is violated
 - the provider is blamed

Contracts and Higher-order functions

$\mathsf{filter}\;((\mathsf{int}\to\mathsf{bool})\;\mathsf{pred}\;):([\mathsf{int}]\to[\mathsf{int}])$

- it receives a predicate to check whether an integer is an even number, and
- ▶ it returns a function that allows to filter the elements of a list that are even

Its contract could be:

- ▶ pre: $\forall x : int.(x \mod 2 = 0) \iff pred x$
- ▶ post: $\forall x : int.x \in (filter pred) \ ls \iff (x \in ls \& x \mod 2 = 0)$

Issues

- Checking of pre- and postconditions
 - we cannot check whether pred satisfies pre when filter is invoked
 - we cannot check if (filter pred) satisfies post on return
- ▶ Blame assignment:
 - if (filter pred) violates the postcondition, it may be because of pred
 - filter may use pred as a parameter when invoking auxiliary functions (and violates the contracts of auxiliary functions)

- An extension of Programming Computable Functions (PCF) with contracts for higher-order functions
- ▶ Expressions can be decorated with contracts that link a client and a provider
- ► Contracts are evaluated only over values of basic types (not over functions)
- When a contract is violated, blame is assigned to either the client or the provider

²Robert Bruce Findler, Matthias Felleisen: ICFP 2002: Contracts for higher-order functions.

³Christos Dimoulas, Robert Bruce Findler, Cormac Flanagan, Matthias Felleisen: Correct blame for contracts: no more scapegoating. POPL 2011.

Programming Computable Functions (PCF)

Syntax

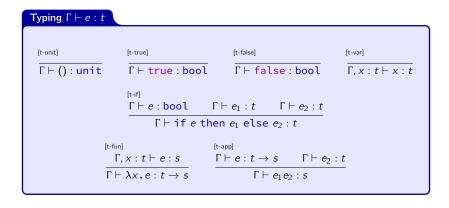

```
Types t ::= b \mid t \rightarrow t

b := int | bool | unit

Expression e ::= v \mid x \mid e_1e_2 \mid if e then e_1 else e_2 \mid \dots ( number expr)

Value v, w ::= () | true | false | \dots | \lambda x \cdot e
```

Programming Computable Functions (PCF)

Programming Computable Functions (PCF)

```
Semantics e \rightarrow e
                                        [if-true]
                                         if true then e_1 else e_2 \rightarrow e_1
                                       [if-false]
                                        if false then e_1 else e_2 \rightarrow e_2
                                                    [beta]
                                                    (\lambda x.e)v \rightarrow e\{v/x\}
                                                        [context]
                                                            e_1 \rightarrow e_2
                                                         \overline{\mathscr{E}[e_1] \to \mathscr{E}[e_2]}
```

$$\mathscr{E}$$
 ::= [] | $\mathscr{E}e$ | $v\mathscr{E}$ | if \mathscr{E} then e_1 else e_2

$mon^{k,l}(\kappa,e)$

- ightharpoonup Contract κ mediates the interaction between e (provider) and its context (client)
- \blacktriangleright any value that flows between e and its context is monitored for conformance with κ
- k and I are the blame labels for the two parties to the contract

error¹

▶ blame is assigned to *I*

flat(e)

- ► A contract for an expression of a basic type unit, bool, unit, ...
- e is a predicate (for values of a basic type)

$$flat(\lambda x.x \ge 0)$$

$\kappa_1 \mapsto \kappa_2$

- ▶ A contract for a function
- ightharpoonup κ_1 is the contract for the domain (the precondition)
- ightharpoonup is the contract for the codomain (the postcondition)

$$flat(\lambda x.x \ge 0) \mapsto flat(\lambda x.x \le 0)$$

```
Types t ::= b \mid t \rightarrow t \mid \operatorname{con}(t)

b := \operatorname{int} \mid \operatorname{bool} \mid \operatorname{unit}

Contracts \kappa ::= \operatorname{flat}(e) \mid \kappa \mapsto \kappa

Expression e ::= v \mid x \mid e_1 e_2 \mid \operatorname{if} e \operatorname{then} e_1 \operatorname{else} e_2 \mid \dots (\operatorname{number} \operatorname{expr})

\mid \operatorname{mon}^{l,l}(\kappa, e) \mid \operatorname{error}^l

Value v, w ::= () \mid \operatorname{true} \mid \operatorname{false} \mid \dots

\mid \lambda x \cdot e \mid
```

Example

```
\begin{aligned} &\mathsf{ge} = \lambda x. x \geq 0 \\ &\mathsf{le} = \lambda x. x \leq 0 \\ &\mathsf{op} = \lambda x. x * (-1) \\ &\mathsf{op}_{\mathsf{mon}} = \mathsf{mon}^{k,l}(\mathsf{flat}(\mathsf{ge}) \mapsto \mathsf{flat}(\mathsf{le}), \mathsf{op}) \end{aligned}
```

```
Typing for contracts \Gamma \vdash e : t
\frac{\Gamma \vdash e : o \to bool}{\Gamma \vdash flat(e) : con(o)} \qquad \frac{\Gamma \vdash \kappa_1 : con(t_1) \quad \Gamma \vdash \kappa_2 : con(t_2)}{\Gamma \vdash \kappa_1 \mapsto \kappa_2 : con(t_1 \to t_2)}
\frac{\Gamma \vdash \kappa : con(t) \quad \Gamma \vdash e : t}{\Gamma \vdash mon^{k,l}(\kappa,e) : t} \qquad \frac{\Gamma \vdash error^l}{\Gamma \vdash error^l : t}
```

```
Semantics e \rightarrow e
                                              [if-true]
                                               if true then e_1 else e_2 \rightarrow e_1
                                             [if-false]
                                             if false then e_1 else e_2 \rightarrow e_1
                                                           [beta]
                                                            (\lambda x \cdot e)v \rightarrow e\{v/x\}
                                                                [context]
                                                                      e_1 \rightarrow e_2
                                                                \mathscr{E}[e_1] \to \mathscr{E}[e_2]
                              [flat]
                              mon^{k,l}(flat(e), v) \rightarrow if ev then v else error^k
                          [func]
                           \operatorname{\mathsf{mon}}^{k,l}(\kappa_1 \mapsto \kappa_2, v) \to \lambda x \cdot \operatorname{\mathsf{mon}}^{k,l}(\kappa_2, v \operatorname{\mathsf{mon}}^{l,k}(\kappa_1, x))
```

$$\mathscr{E} ::= [] | \mathscr{E}e | v\mathscr{E} | | \text{if } \mathscr{E} \text{ then } e_1 \text{ else } e_2 | \text{mon}^{l,l}(\kappa,\mathscr{E})$$

Example

```
\begin{split} \text{ge} &= \lambda x \boldsymbol{.} x \geq 0 \\ \text{le} &= \lambda x \boldsymbol{.} x \leq 0 \\ \text{op} &= \lambda x \boldsymbol{.} x * (-1) \\ \text{op}_{\text{mon}} &= \text{mon}^{k,l}(\text{flat(ge)} \mapsto \text{flat(le)}, \text{op}) \\ \text{op}_{\text{mon}} &\to \lambda x \boldsymbol{.} \text{mon}^{k,l}(\text{flat(le)}, \text{op} \text{mon}^{l,k}(\text{flat(ge)}, x)) \end{split}
```

$op_{mon}1$

```
\begin{array}{l} \operatorname{op_{mon}} 1 \to (\lambda x . \operatorname{mon}^{k,l}(\operatorname{flat}(\operatorname{le}), \operatorname{op\ mon}^{l,k}(\operatorname{flat}(\operatorname{ge}), x))) \ 1 \\ \to \operatorname{mon}^{k,l}(\operatorname{flat}(\operatorname{le}), \operatorname{op\ mon}^{l,k}(\operatorname{flat}(\operatorname{ge}), 1)) \\ \to \operatorname{mon}^{k,l}(\operatorname{flat}(\operatorname{le}), \operatorname{op\ if\ ge\ 1} \ \operatorname{then\ 1} \ \operatorname{else\ error}^l) \\ \to \operatorname{mon}^{k,l}(\operatorname{flat}(\operatorname{le}), \operatorname{op\ if\ true\ then\ 1} \ \operatorname{else\ error}^l) \\ \to \operatorname{mon}^{k,l}(\operatorname{flat}(\operatorname{le}), \operatorname{op\ if\ true\ then\ 1} \ \operatorname{else\ error}^l) \\ \to \operatorname{mon}^{k,l}(\operatorname{flat}(\operatorname{le}), \operatorname{op\ if\ true\ then\ 1} \ \operatorname{else\ error}^l) \\ \to \operatorname{mon}^{k,l}(\operatorname{flat}(\operatorname{le}), \operatorname{op\ if\ if\ le\ (-1)}) \\ \to \operatorname{mon}^{k,l}(\operatorname{flat}(\operatorname{le}), (-1)) \\ \to \operatorname{mon}^{k,l}(\operatorname{flat}(\operatorname{le}), (-1)) \\ \to \operatorname{if\ le\ (-1)\ then\ (-1)\ else\ error}^k \\ \to \operatorname{if\ true\ then\ (-1)\ else\ error}^k \\ \to \operatorname{if\ true\ then\ (-1)\ else\ error}^k \\ \to (-1) \end{array}
```

Example

```
\begin{split} \mathsf{ge} &= \lambda x \boldsymbol{.} x \geq 0 \\ \mathsf{le} &= \lambda x \boldsymbol{.} x \leq 0 \\ \mathsf{op} &= \lambda x \boldsymbol{.} x * (-1) \\ \mathsf{op}_{\mathsf{mon}} &= \mathsf{mon}^{k,l}(\mathsf{flat}(\mathsf{ge}) \mapsto \mathsf{flat}(\mathsf{le}), \mathsf{op}) \\ \mathsf{op}_{\mathsf{mon}} &\to \lambda x \boldsymbol{.} \mathsf{mon}^{k,l}(\mathsf{flat}(\mathsf{le}), \mathsf{op} \; \mathsf{mon}^{l,k}(\mathsf{flat}(\mathsf{ge}), x)) \end{split}
```

$op_{mon}(-1)$

```
\begin{array}{l} \operatorname{op_{mon}}(-1) \to (\lambda x. \operatorname{mon}^{k,l}(\operatorname{flat}(\operatorname{le}), \operatorname{op\ mon}^{l,k}(\operatorname{flat}(\operatorname{ge}), x))) \ (-1) \\ \to \operatorname{mon}^{k,l}(\operatorname{flat}(\operatorname{le}), \operatorname{op\ mon}^{l,k}(\operatorname{flat}(\operatorname{ge}), (-1))) \\ \to \operatorname{mon}^{k,l}(\operatorname{flat}(\operatorname{le}), \operatorname{op\ if\ ge\ } (-1) \ \operatorname{then\ } (-1) \ \operatorname{else\ error}^l) \\ \to \operatorname{mon}^{k,l}(\operatorname{flat}(\operatorname{le}), \operatorname{op\ if\ } (-1) \ge 0 \ \operatorname{then\ } 1 \ \operatorname{else\ error}^l) \\ \to \operatorname{mon}^{k,l}(\operatorname{flat}(\operatorname{le}), \operatorname{op\ if\ } \operatorname{false\ then\ } 1 \ \operatorname{else\ error}^l) \\ \to \operatorname{mon}^{k,l}(\operatorname{flat}(\operatorname{le}), \operatorname{error}^l) \\ \to \operatorname{error}^l \end{array} The blame is assigned to the client
```

Example

```
\begin{split} \mathsf{g} &= \lambda x. x \geq 0 \\ \mathsf{l} &= \lambda x. x \leq 0 \\ \mathsf{op} &= \lambda x. x \\ \mathsf{op}_{\mathsf{mon}} &= \mathsf{mon}^{k,l}(\mathsf{flat}(\mathsf{ge}) \mapsto \mathsf{flat}(\mathsf{le}), \mathsf{op}) \\ \mathsf{op}_{\mathsf{mon}} &\to \lambda x. \mathsf{mon}^{k,l}(\mathsf{flat}(\mathsf{le}), \mathsf{op} \ \mathsf{mon}^{l,k}(\mathsf{flat}(\mathsf{ge}), x)) \end{split}
```

$\text{op}_{\text{mon}}\mathbf{1}$

```
\begin{array}{c} \mathsf{op}_{\mathsf{mon}} 1 \,\to\, (\lambda x . \mathsf{mon}^{k,l}(\mathsf{flat}(\mathsf{le}), \mathsf{op} \; \mathsf{mon}^{l,k}(\mathsf{flat}(\mathsf{ge}), x))) \,\, 1 \\ \,\to^* \; \mathsf{mon}^{k,l}(\mathsf{flat}(\mathsf{le}), \mathsf{op} \,\, 1) \\ \,\to\, \; \mathsf{mon}^{k,l}(\mathsf{flat}(\mathsf{le}), 1) \\ \,\to\, \; \mathsf{if} \;\, \mathsf{le} \,\, 1 \;\, \mathsf{then} \,\, 1 \;\, \mathsf{else} \;\, \mathsf{error}^k \\ \,\to\, \;\; \mathsf{if} \,\, 1 \leq 0 \;\, \mathsf{then} \,\, 1 \;\, \mathsf{else} \;\, \mathsf{error}^k \\ \,\to\, \;\; \mathsf{if} \,\, \mathsf{false} \;\, \mathsf{then} \,\, 1 \;\, \mathsf{else} \;\, \mathsf{error}^k \end{array}
```

Dependent contracts

$$\kappa := \dots \mid \kappa \stackrel{d}{\mapsto} (\lambda x \cdot \kappa)$$

Example

$$\begin{aligned} & \mathsf{succ} = \lambda x. x + 1 \\ & \kappa = \mathsf{flat}(\lambda x. \mathsf{true}) \overset{d}{\mapsto} (\lambda x. \mathsf{flat}(\lambda y. y > x)) \\ & \mathsf{succ}_{\mathsf{mon}} = \mathsf{mon}^{k,l}(\kappa, \mathsf{succ}) \end{aligned}$$

Dependent contracts

Typing for contracts $\Gamma \vdash e : t$

[t-contract]

$$\frac{\Gamma \vdash \kappa_1 : \mathsf{con}(t_1) \quad \Gamma \vdash \kappa_2 : t_1 \to \mathsf{con}(t_2)}{\Gamma \vdash \kappa_1 \overset{d}{\mapsto} \kappa_2 : \mathsf{con}(t_1 \to t_2)}$$

Semantics $e \rightarrow e$

[d-func]

$$\overline{\mathsf{mon}^{k,l}(\kappa_1 \overset{d}{\mapsto} (\lambda x . \kappa_2), v) \to \lambda x . \mathsf{mon}^{k,l}(\kappa_2, v \ \mathsf{mon}^{l,k}(\kappa_1, x))}$$

Dependent Contract

Example

$$\begin{aligned} & \mathsf{succ} = \lambda x.x + 1 \\ & \kappa = \mathsf{flat}(\lambda x.\mathsf{true}) \overset{d}{\mapsto} (\lambda x.\mathsf{flat}(\lambda y.y > x)) \\ & \mathsf{succ}_{\mathsf{mon}} = \mathsf{mon}^{k,l}(\kappa,\mathsf{succ}) \end{aligned}$$

$$\mathsf{succ}_{\mathsf{mon}} \to \lambda x.\mathsf{mon}^{k,l}(\mathsf{flat}(\lambda y.y > x), \mathsf{succ}\;\mathsf{mon}^{l,k}(\mathsf{flat}(\lambda x.\mathsf{true}), x))$$

succ_{mon} 2

```
\begin{array}{l} \operatorname{succ_{mon}} \to (\lambda x.\operatorname{mon}^{k,l}(\operatorname{flat}(\lambda y.y>x),\operatorname{succ}\,\operatorname{mon}^{l,k}(\operatorname{flat}(\lambda x.\operatorname{true}),x))) \ 2 \\ \to \operatorname{mon}^{k,l}(\operatorname{flat}(\lambda y.y>2),\operatorname{succ}\,\operatorname{mon}^{l,k}(\operatorname{flat}(\lambda x.\operatorname{true}),2)) \\ \to^* \operatorname{mon}^{k,l}(\operatorname{flat}(\lambda y.y>2),\operatorname{succ}\,2) \\ \to^* \operatorname{mon}^{k,l}(\operatorname{flat}(\lambda y.y>2),3) \\ \to^* 3 \end{array}
```
